**Checklist of the Flora of Wadi Haboonat Al Jabal Al Akhdar
(Cyrenaica, Libya)**

El Rabiai ¹G.T. and M. Al tira²

1, 2: Botany Department, Science Faculty, Benghazi University, Libya

Abstract

The flora of Wadi Haboon was studied and analyzed. In this work, a preliminary checklist of the plant species of the Wadi was provided. The investigation revealed the presence of 43 families, 136 genera and 166 species. This information could eventually aid in interpreting changes in populations due to man-made alterations.

Key-Words: Libya, Flora, Taxonomy, Wadi Haboon

Introduction

Al-Jabal Al-Akhdar (Green Mountain), a low to medium mountainous landscape, is located in the northeast of Libya; reaching 878 m above sea level was created as a result of a tectonic elevation of a primary plain of marine accumulation. It is characterized by a Mediterranean climate, with cool rainy winter and hot dry summer (El-Tantawi, 2005). Al-Jabal Al-Akhdar is one of the four major centers of endemism which holds about 50% of the total endemic species in Libya (Boulos, 1997; Davis et al., 1994). Wadi Haboon lies between 21° 08' 42" and 21° 09' 54" E longitude and 32° 43' 48" and 32° 42' 36" N latitude on the North east region, Al-Jabal Al-Akhdar. The Wadi rises 100 meters above sea level and pours in the basin of "almlekh" on the Mediterranean coast in the Cyrenaica region (Figs. A&B).

Wadi Haboon is one of the valleys that branch out from Wadi Al Koof such as other valleys like wadi Al-mlekeh, Al-laleb and Shloof. It is about 9 km north-east of Battah and Tolmeita area and about 8 km southeast of Ain Al-mlekeh. It descends towards the north and empties into the sea in the Al-mlekeh Basin.

Material and Methods

The present work is based on intensive field work upon several visits between the periods of 2005 to 2011. The plant collections were treated following the general Herbarium techniques then deposited in the Cyrenaica Herbarium (CH) at the Botany Department (Sciences faculty, Benghazi University).

The Checklist

The checklist's family sequence started with gymnosperms followed by the angiosperms, monocots and then the dicots. Genera and species are arranged alphabetically within each family.
